Library 4.0d Update
Done!

- ALLAPPS Fix scripts for navigating to other apps.

- FIND Fix find script which was deleting information! Opps!

- HELP Improve and add new help scripts to insure user gets the correct column in the help app for the layout on which they clicked the help button.

- HELP Add QV dialogue box info to help and new Insert Reference button and window.

- LEARN For learn and tag records with media and when the media is not showing, present the user with an icon that indicates the record has media. If the user clicks this icon they are asked if they would like to view the media.

- LEARN Create a module for viewing and adding references to learn record when on the edit screen.

- LEARN Improve image view for tags that have media that allows users to elect to show and not show the media.

- LEARN Create a close window script that resets pause for find and other windows that must be closed before the user is allowed to do anything else (which the pause command insures).

- LEARN In inventory mode, remove reference and test module navigation buttons and create the ability to create reference/location records in the location tag menus window.

- LEARN Fix QV close script so Learn records are resorted if the user changed the time of the record thus changing its location in the list of timestamped notes.

- LEARN Improve Share script by telling users how many linked records there are. Also improve QV layout by giving user the linked and referenced records totals.

- LEARN Remove website button from open file dialogue box as there is a web button for opening websites and does not need to be in this dialogue box.

- LEARN For location mode, create three locked location groups cannot be accessed or changed: primary, secondary, tertiary. This will force users to think of their primary location, and then a location within it and finally a location within that sublocation.

- LEARN Create a feature so when clicking the # or time button the systems asks if you want to use the information from any of your references for the record, and if so it opens a window showing all of them for you to click one!

- REFERENCE Fix catchFindReferenceErrorMessages script so it keeps the find request in the find reference field. Right now it is failing to do this and so not returning all records to be found.

REFERENCE Reduce author names on the short reference field shown in list views to just the first author, so title of work can be seen, which it cannot if the author's name is government department, or their are 20 authors!

REFERENCE Remove key word listing from shared references as they are useful internally, but probably mean nothing and take up a lot of space when sharing ideas with references attached.

SETUP Improve lock record message to inform user that the lock is easily picked if the user has a copy of FileMaker.

SETUP Improve start script to create a better user experience including showing all setup reference records after import is completed.

SETUP Remove timer button from all menus and use an app button instead that asks user if the want to go the action log or if they want to go to the all apps menu.

TEST Add ability to apply ! to form items that are completed like weight lifting exercise! Then when a new exercise test record is created, ask user if they wish to remove these ! marks. This way they can be used again to indicate when a form item is completed.

TEST Fix newTestResult script so it doesn't fail when user elects the new form option, AND add a feature that scrubs ! from pasted form copies if the user is using ! to indicated completed form items, so if using a form to check of exercises, it is useful to clear the ! from the copied and completed exercise form to start a new workout.

TEST Create archive script that when archive button is clicked on the checklist window, the script transfer headers and items to the main record window. Checked items get a black check, and unchecked items get a gray check?
